Team ID	SWTID-2026-8365
Project Name	Import Data using Transform Maps – ServiceNow Employee Data Import
Maximum Marks	4 Marks

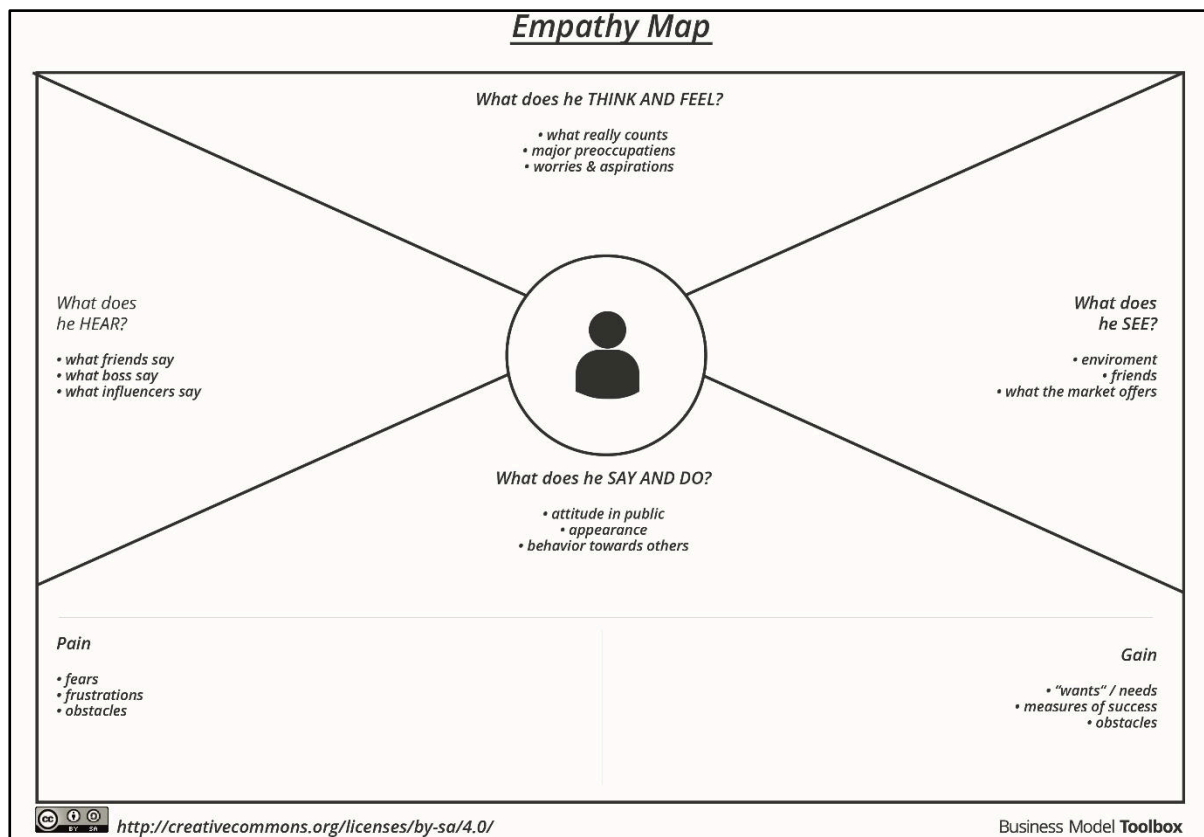

Empathy Map Canvas:

An empathy map is a simple, easy-to-digest visual that captures knowledge about a user's behaviours and attitudes.

It is a useful tool to help teams better understand their users.

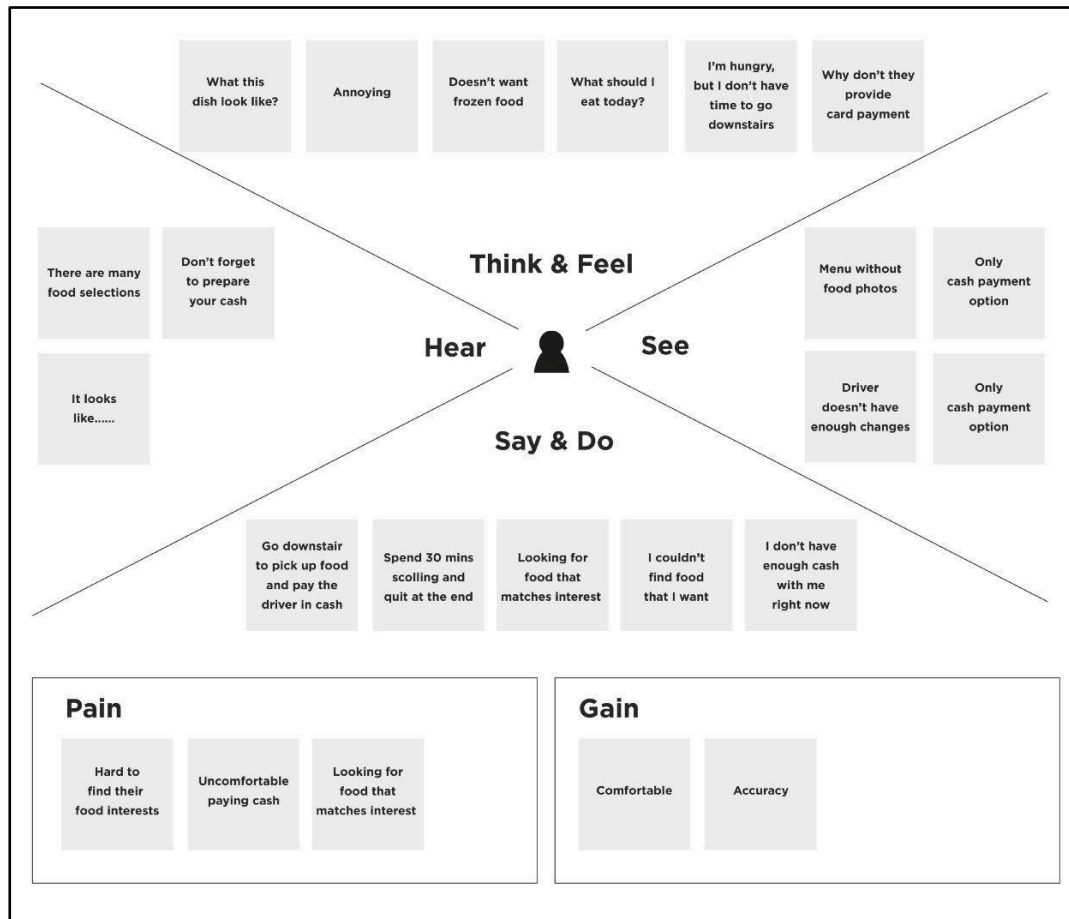

Creating an effective solution requires understanding the true problem and the person who is experiencing it. The exercise of creating the map helps participants consider things from the user's perspective along with his or her goals and challenges.

Example:

Example: Food Ordering & Delivery Application

Empathy Map: ServiceNow Employee Data Import

User: A ServiceNow administrator who works with HR and has to move bulk employee data from Excel into ServiceNow, keep it free of duplicates, and report on it.

What does the user THINK and FEEL? • Will the data load correctly the first time? • I hope I don't create duplicate employee records. • A typo in a name, email or department will spread to every report. • I want a quick process I can repeat for every new file. • Relieved when I see State: Complete and Completion code: Success.		
What does the user HEAR? • Manager: "We need the latest employee list in ServiceNow today." • HR team: "Some details changed, please update them." • Colleagues: "Don't type 15 records by hand." • Trainers: "Use Import Sets and Transform Maps for bulk data."	ServiceNow Administrator / HR Data Administrator Imports and maintains employee data from Excel sheets	What does the user SEE? • Employee data arriving as Excel sheets. • The same Employee ID appearing again with a new email or name. • Progress messages after Load Data and Transform. • Inconsistent values such as "Servicenow" instead of "ServiceNow". • Record counts in Transform History.
What does the user SAY and DO? • "Let me download the sheet as .xlsx and load it." • Creates the table u_employee_test and loads the file into u_employee_import. • Creates a Transform Map, maps the fields and runs Transform. • Re-imports an updated sheet to check updates and ignored rows. • Builds reports and a dashboard to share the results.		
Pain • Manual data entry is slow and error-prone. • Re-imported data creates duplicate records. • Inconsistent values and typos reduce data quality. • No quick summary of employees by department or location.	Gain • Accurate data with no duplicates (Coalesce on Employee ID). • Time saved through bulk import and a repeatable process. • Updates applied to existing records automatically. • Clear visibility through the Employee Analytics Dashboard.	

Key insight: The user does not only need the data imported. They need to trust it. Import Sets give a safe staging area, the Transform Map gives control over field mapping, Coalesce on Employee ID removes the fear of duplicates, and the reports and dashboard turn the clean data into insight.
